one of the first books in this area this text focuses on important aspects of the system operation analysis and performance evaluation of selected chaos based digital communications systems a hot topic in communications and signal processing

this book introduces different interconnection networks applied to different systems interconnection networks are used to communicate processing units in a multi processor system routers in communication networks and servers in data centers queuing techniques are applied to interconnection networks to support a higher utilization of resources there are different queuing strategies and these determine not only the performance of the interconnection network but also the set of requirements to make them work effectively and their cost routing algorithms are used to find routes to destinations and directions in what information travels additional properties such as avoiding deadlocks and congestion are sought effective routing algorithms need to be paired up with these networks the book will introduce the most relevant interconnection networks queuing strategies and routing algorithm it discusses their properties and how these leverage the performance of the whole interconnection system in addition the book covers additional topics for memory management and congestion avoidance used to extract higher performance from the interconnection network

this text uses the principles of discrete time signal processing to introduce and analyze digital communications connecting continuous time and discrete time ideas the text brings under one cover the theoretical and practical issues from discrete time signal processing discrete time filter design multi rate discrete time processing estimation theory signal space analysis numerical algorithms all focused on digital communications a useful reference for programmers

this thesis is concerned with the efficient design of digital modulation and error control schemes for point to point meteor scatter communication systems the methods introduced exploit the unique properties of the meteor scatter channel a channel model is derived based on the work of other researchers the channel model includes expressions for meteor arrival rate burst duration and received power meteor arrivals are modeled as a poisson random process and the properties of the poisson process are used extensively channel noise is modeled as additive white and gaussian distributed the multipath structure of the channel is evaluated only to the extent that it affects channel bandwidth new expressions for long run average bit rate and mean message waiting time bounds on the improvement in mean waiting time over the fixed rate modem are derived m ary modulation methods are investigated to find the optimal modulation for the fixed rate modem and adaptive symbol rate modem it is shown that the adaptive symbol rate modem is not optimal on a bandwidth limited channel an alternative scheme called adaptive quadrature amplitude modulation qam is evaluated and shown to outperform adaptive symbol rate modulation on a bandwidth limited channel rh
