1 Which of the following is NOT a component of a nucleotide a Phosphate group b Sugar deoxyribose or ribose c Amino acid d Nitrogenous base Answer c Amino acid Explanation Nucleotides are the building blocks of DNA and RNA They consist of a 2 phosphate group a sugar molecule deoxyribose in DNA ribose in RNA and a nitrogenous base adenine guanine cytosine thymine or uracil Amino acids on the other hand are the building blocks of proteins Think of it like this nucleotides are the bricks and proteins are the houses built from those bricks following the blueprint laid out by the DNA

2 What is the process by which DNA is copied a Translation b Transcription c Replication d Mutation Answer c Replication Explanation DNA replication is the process where a cell makes an identical copy of its DNA before cell division Transcription is the process of creating RNA from a DNA template and translation is the process of creating a protein from an RNA template Mutations on the

other hand are changes in the DNA sequence Imagine DNA replication as a perfect photocopy machine ensuring that each new cell receives an exact copy of the genetic instructions

3 What determines a persons blood type A B AB O a The sequence of amino acids in a protein b The presence or absence of specific alleles c The number of chromosomes d The amount of DNA in a cell Answer b The presence or absence of specific alleles Explanation Blood type is determined by the presence or absence of specific antigens A and B on the surface of red blood cells These antigens are coded for by different alleles of a single gene This is a prime example of Mendelian inheritance where simple rules govern the expression of traits The classic example of a blood type inheritance chart vividly demonstrates the interaction of alleles to produce the four blood types

4 What is a phenotype a The genetic makeup of an organism b The physical characteristics of an organism c The environment of an organism d The mutations in an organisms DNA Answer b The physical characteristics of an organism 3 Explanation The phenotype is the observable trait the outward expression of the genotype the genetic makeup For example a persons eye color height and susceptibility to certain diseases are all phenotypic traits Its the visible manifestation of the genetic code influenced by both genes and the environment

5 What is a karyotype a A type of mutation b A complete set of chromosomes arranged in pairs c A specific gene d A type of protein Answer b A complete set of chromosomes arranged in pairs Explanation A karyotype is a visual representation of an individuals chromosomes Its like a genetic fingerprint showing the number and structure of chromosomes Karyotyping is a powerful tool used in genetic diagnosis helping identify chromosomal abnormalities such as Down syndrome or Turner syndrome Imagine it as a carefully organized map of the genetic landscape of an individual

6 What are linked genes a Genes that are located on different chromosomes b Genes that are located close together on the same chromosome c Genes that code for the same protein d Genes that are always expressed Answer b Genes that are located close together on the same chromosome Explanation Linked genes tend to be inherited together because they are physically close on the chromosome This linkage is broken occasionally through crossingover during meiosis resulting in genetic recombination adding variation to the genetic pool Think of them as close friends travelling together rarely getting separated
